Disclosure; Fig 1; 8pp; Japanese.

The sequence shows the exon 2 alpha-1-domain of the human leukocyte antigen-Bw 52 gene. The complete gene may be introduced into non-man mammals, pref. rat or mouse, or their encestors at the primary developmental biological step via transplantation into the zygote or embryo to generate transgenic non-human mammals incorporating the con-human mammals contq. HLA-Bw 52 gene in both their germ cells and somatic cells. Transgenic non-human mammals contq. HLA-Bw 52 are useful for the analysis of expression of the gene, its structure, and prodn. of mouse models of human disease.

New DNA for class 1 human leucocyte antigens and derived probes and transformed cells, useful for DNA typing, as immunogens etc.
Claim 2: ppil-12; 23pp; English.
The HLA class I DNA can be used a source of probes for use in DNA typing. Transformed cells, which are useful as immunogens, can be obtained by introducing these DNAs into eucaryotic cells.

Allotype specific monoclonal anti- HLA antibodies prodn. - using
Thickpe specific monoclonal anti- HLA antibodies prodn. - using
Thybridomas derived from transgenic animals carrying HLA gene and
Thybridomas derived from transgenic animals carrying HLA gene and
The human is a 1 A-G; 20pp; English.
The human HLA-B51 gene was injected into fertilised mouse eggs and
then these introduced into the uterus of a pseudo pregnant mouse.
The young were tested to ensure incorporation of the gene into the
Chromosome, and one of them mated 3 times with a normal male to
produce 16 young, seven of which carried the HLA-B51 gene.
The transgeneic offspring were immunised with HLA antigen.
The spleen lymphocytes were fused with myeloma cells. Hybridomas
C producing antibodies were selected.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 03-JAN-1991 (first entry)

Such DNA, antigen of antibody Claim 2: Page 4: 5pp: German.

Claim 2: Page 4: 5pp: German.

Lamb DNA may be used as a hybridisation probe for detecting the HLA B27 gene, e.g. for assessing susceptibility to rheumatic disorders such as ankylosis spondylitis, or may be used to transform cells for prodn. of HLA B27. The HLA B27 may be used to detect HLA B27 antibody in human serum, or to produce mono- or polyclonal HLA B27 antibodies for use in immunoassay.

Sequence encoding the human histocompatibility antigen HLA B27.
Sequentic disorder; genetic screening; diagnosis;
ankylosing spondylitis; ss.
Homo sapiens.
 Claim 1; Page 1; 11pp; Japanese.

Probes comprising part of the sequence can be used to identify class I genes. The DNA can be expressed for immunisation of animals and prodn. of monoclonal antibodies specific for the HIA-BW53 antigen. See also J03112485 and J03112486.

 DNA coding for human histocompatibility antigen HLA-B 27 - useful for diagnosis and antigen and antibody prodn.

Claim 1, p6; 13pp; German.

THE DNA may be used to detect the HLA-B 27 gene (opt. mutated) in human genetic material. The HLA-B 27 may be used to detect anti-HLA-B 27 antibodies in human serum. The antibodies may be used to determine HLA-B 27 lavels in human serum, e.g., for diagnosis of rheumatic disorders, esp. ankylosing spondylitis.

Detecting pre-disposition to seronegative spondylarthropathies -
Trom the absence of a C residue at a specific position in the
Trom the absence of a C residue at a specific position in the
3'-flanking region of the HLA B27 allele
C claim 1; Page 52-56; 68pp; English.
Genetic predisposition to seronegative spondyloarthropathies (SNSA)
is detected by determining the absence of a cytosine nucleotide in
the 3' flanking region (see also T61647-48) of an HLA-B3 gene at a
position corresponding to nucleotide 4495 of the HLA-B37 consensus
sequence given in T61639. Probes and primers (see also T61640-46)
c based on this region can be used in diagnostic assays to detect the
genetic predisposition to SNSA, and permit the distinction of B27+
individuals who are resistant to SNSA from B27+ normal individuals
who are susceptible (but as yet unaffected) to such diseases.

                                                                                                                                  x51701-55 encode human secreted proteins. The polynucleotides and their corresponding secreted proteins. The polynucleotides and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene treating or ameliorating medical conditions or a per protein or gene conditions and also be diagnosed by determining the presence of mutations in the new polynucleotides. Specific uses are presence of mutations in the new polynucleotides, Specific uses are described for each polynucleotide, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, immune disorders, infection, inflammatory disorders, skin disorders, tumours, atheroscierosis, restenosis, autoimmune disorders, alzheimer's disease, peripheral neuropathies, trauma, spinal cord injuries, allergy, hematopoietic disorders, asthma, immunodeficiency diseases, AIDS and transplant rejection. The polypeptides are also useful for identifying their
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated human genes
(Claim 2; Page 126-129; 184pp; English.
This sequence represents a human gene of the invention, that is induced
to express by both HCWV and interferon (IFN), designated HCMV-inducible
genes (cig or cigs). The invention also relates to genes that are
repressed in the presence of HCMV infection, designated HCMV-repressible
genes (crg or crgs). The products can be used to obtain agents which can
be used for anti-viral therapy, particularly anti-HCMV therapy. They can
also be used for the development of drugs that would allow for higher
dosage IFN treatments without the concomitant toxicity normally
associated with administering high levels of IFN. The products can also
be used for detection, diagnosis and drug screening.
                                                                  New isolated human genes and the secreted polypeptides they encode useful for diagnosis and treatment of e.g. neurological disorders, tumours, immune disorders, inflammation or haematological disorders Claim 1: Page 170: 215pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human HCMY inducible gene, SEQ ID NO 17.

Trivial managed and a sequence encoding fungal galactanase - useful in production of wine or modification of animal feed, e.g. depectinisation, and reducing viscosity of plant cell wall derived material claim 1; Pages 34.36; 49pp; English.

Traducing viscosity of plant cell wall derived material claim 1; Pages 34.36; 49pp; English.

This cDNA sequence encodes a novel galactanase isolated from a fine constructed in E. coli. Positive cDNA inserts were dentified on SC-agar plates using the AZCL xylan assay. cDNA inserts were amplified directly from yeast colonies. In order to express the galactanase in Aspergillus, the DNA was digested with appropriate restriction enzymes, size fractionated on a gel and a fragment corresponding to the galactanase gene purified. The gene was subsequently ligated into pHA414 and digested with appropriate restriction enzymes to give pA2655. After amplification of the DNA in E. coli the plasmid was transformed into Aspergillus oryzae and transformant activity was analysed. The galactanase can be used to reduce the viscosity of plant cell wall derived material, thus having implications in wine production, the preparation of fruit or vegetable juice or for the modification of animal feed allowing a significant in the in vivo breakdown of plant cell wall material e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI; 99-081273/07.

New isolated Treponema pallidum nucleic acids - used to develop products for the detection, diagnosis, characterisation, prevention and therapy of T. pallidum infections, particularly syphilis claim 1; Page 799-800; 1150pp; English.
X20500-21243 represent polynucleotide sequences from the genome of Treponema pallidum. The sequences can be used for detection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  05-MAY-1999 (first entry)
Polynucleotide sequence from the genome of Treponema pallidum.
Treponema pallidum infection; syphilis; Borrelia infection; animal;

NOVel immunomedulatory peptide-type compound - useful for inhibiting
                                                                                                                                                                                                                                                                                                                                                                      transplant rejection

Claim 10: Page 36: 41pp: English.

The present rejection

Chaim 10: Page 36: 41pp: English.

The present sequence is an immunomodulatory peptide, which

comprises a class I HiA-B alpha-1 domain sequence. It can be used

in a pharmaceutical composition together with a subtherapeutic dose

of an immunosuppressant, to extend the period of acceptance of a

transplant from a major histocompatibility complex (MHC) unmatched

donor, i.e. to inhibit transplant rejection. It can also be used in

the treatment of autoimmune diseases.

Peptides using the D-form amino acids are more effective

immunomodulators than their diastereomers or enantiomers.
                                                                                                                                                                                                         the
                                                                                                                                                                                    7..10

Novel immunomodulatory peptide-type compound - useful for inhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                   immunomodulatory peptide-type compound - useful for inhibiting
                                                                                                                                                                                                                   Comprises a Class I HLA-B alpha-1 domain sequence. It can be used in a pharametrical composition together with a subtherapeutic dose of an immunosuppressant, to extend the period of acceptance of a transplant from a major histocompatibility complex (MHC) unmatched donor, i.e. to inhibit transplant rejection. It can also be used in the treatment of autoimmune diseases. Peptides using the D-form amino acids are more effective immunomodulators than their disastereomers or enantiomers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             transplant rejection
Claim 10; Page 36; 41pp; English.
The present sequence is a immunomodulatory peptide, which
comprises a Class I HAAB alpha-1 domain sequence. It can be used
in a pharmaceutical composition together with a subtherapeutic dose
of an immunosuppressant, to extend the period of a coeptance of a
transplant from a major histocompatibility complex (MHC) unmatched
donor, i.e. to inhibit transplant rejection. It can also be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

R83061-R83085, R83090-R83096 and R82907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLs)
HIA-B2702 CTL modulating peptide (B2702.84-75/75-84(T)). Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HIA-B2702.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         HLA-B2702 CTL modulating peptide (B2702.84-75/84-75).
Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC;
immunosuppressant; graft versus host disorder; transplantation; therapy;
class I MHC; HLA-B2702.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example 15; Page 36; 80pp; English. R83061-R92085, R83085, R83080-R83085 and R92907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is a dimer of residues 75-84 of the alpha-1 domain of the class I MHC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                        Extension of acceptance period of transplants from MHC unmatched donor hosts - using Class I B75-84 MHC antigen of the recipient

R83061-R83085, R83090-R83096 and R92907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HLA-B2702.

These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (comparate to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLs)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

Claim 16; Page 35; 41pp; English.

This sequence represents a specifically claimed immunomodulating dimer peptide of the invention. A peptide-type compound or variant is claimed which has immunomodulating activity, including the N-terminal acylated and/or C-terminal amidated or esterified forms of up to 60 amino acids, where the peptide-type compound comprises the formula; A-B, where A, B = (R Ranfe-7TL) (aa84-79) (Laa77-76R); aa76 = E or V; aa77 = D, S or N; aa79 = R or G; aa80 = I or N; aa81, aa84 = a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                19-JUN-1998 (first entry)
Immunomodulating dimer peptide #1.
Immunomodulating dimer immunosuppressant drug; CTL activation:
transplantation; autoimmune disease; Class I HLA-B alpha-1 domain;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     89.8%; Score 44; DB 1; Length 20; 90.0%; Pred. Treating autoimmune diseases

Claim 16; Page 35; 41pp; English.

This sequence represents a specifically claimed immunomodulating
This sequence represents a specifically claimed immunomodulating
Claim 16; Page 35; 41pp; English.

This sequence represents a specifically claimed immunomodulating
Claimed which has immunomodulating activity, including the N-terminal
acylated and/or C-terminal amidated on esterified forms of up to 60.0

acylated and/or C-terminal amidated on esterified forms of up to 60.0

acylated and/or C-terminal amidated on esterified forms of up to 60.0

where A, B -(R aa76-77L) (aa79-84) or (aa84-79) (Laa77-76R); aa76 = E or V; aa77 = D, S or N; aa79 = R or G; aa80 = I or N; aa81, aa84 = a

tylaphobic or small amino acid; aa80 = I or N; aa81, aa84 = a

represents amino acid; The sequence in the brackets may optionally be
absent or truncated at any peptide type bond within the brackets. The
compounds comprise amino acid; sequences related to a Class I HLA-B

alphal domain (positions 79-84). They can be used to inhibit cyctocxic

T-lymphocytes (CTL) from undesirably attacking cells in a host or in
vitro. They can also be used in combination with antigenic peptides or
proteins of interest to activate CTLS. They can also inhibit the
products can also be used for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                    ö
hydrophobic or small amino acid; aa82 = R or L; aa83 = G or R; and aa represents amino acid. The sequence in the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The compounds comprise amino acid sequences related to a Class I HLA·B alphal domain (positions 79-84). They can be used to inhibit cytotoxic T·Iymphocytes (CTL) from undesirably attacking cells in a host or in vitro and also be used in combination with antigenic peptides or proteins of interest to activate CTLS. They can also inhibit the proliferation of T cells in response to anti-CD3. The peptide can be used for preventing rejection of transplants or for treating autoimmune diseases, e.g. diabetes, rheumatoid arthritis and lupus erythematosis.
                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Immunomodulating dimer peptide #2.

The immunomodulating dimer peptide(s) - based on a class I HiA-B alpha-1 domain, used for preventing rejection of transplants or treating autofimmune diseases.

Treating autofimmune diseases.

Example 1: Page 19: 41pp: English.

Peptides W33784-98 and W33778-9 were assayed for their immunomodulating crivity. A peptide-type compound or variant is claimed which has a munomodulating activity, including the N-terminal acylated and/or c-terminal amidated or esterified forms of up to 60 amino acids, where the peptide-type compound comprises the formula A-B, where A, B = C c. terminal amidated or esterified forms of up to 60 amino acids, where the peptide-type compound comprises the formula A-B, where A, B = C c. R and A-70-71, [aa79-84] or I, aa89 - I or N; aa81 - a hydrophobic or small amino acid; aa82 - R or I; aa83 - G or R; and as represents amino acid sequences related to a class I HiA-B alphal domain (positions at any peptide type bond within the brackets. The compounds comprise amino acid sequences related to a class I HiA-B alphal domain (positions or yead in combination with antigenic peptides or proteins of interest to activate CTLS. They can also inhibit the proliferation of T cells in a ceptome to anti-CD3. The peptide can be used for preventing rejection of transplants or for treating anticimmune diseases, e.g. diabetes.

R83061-R83085, R83090-R831096 and R82307-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (comparade to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Composite computation lymphoid surface membrane proteins - which may inhibit cytolytic activity and differentiation of CTLs.

Example; Page 12; 29pp; English.

R95413, and R95415-R95431 represent palindromes and fragments of human-leucocyte-associated antigens. This sequence represents the human-leucocyte-associated antigens. This sequences can be used to isolate the protein p74 from a T-cell lysate. p74 is a T-cell surface membrane protein associated with T-cell activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein Rsc70. p74 is found in a limited number of cell types, but is particularly expressed on B and T cells. p74 can be isolated by lysis of
                                                                                                                    HLA-B2702 CTL modulating peptide (B2702.84-75(T)/75-84).
Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; minunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Example 15; Page 36; 80pp; English.

R83061-R83085, R83096-R83096 and R92007-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLs) of the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   HIA-B2702 CTL modulating peptide (B2702.84-75(T)/75-84(T)). Cytocoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                      Novel immunomodulatory peptide-type compound - useful for inhibiting transplant rejection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                 The present sequence is an immunomodulatory peptide, which comprises a class I HLA-B alpha-1 domain sequence. It can be used in a pharmaceutical composition together with a subtherapeutic dose of an immunosuppressant, to extend the period of acceptance of a transplant from a major histocompatibility complex (MHC) unmatched donor, i.e. to inhibit transplant rejection. It can also be used in the treatment of autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Extension of acceptance period of transplants from MHC unmatched donor hosts - using Class I B75-84 MHC antigen of the recipient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

Treating autoimmune diseases

Example 1; Page 19; 41pp; English.

Peptides Waish4-98 and Waish78-9 were assayed for their immunomodulating crivity. A peptide-type compound or variant is claimed which has immunomodulating activity, including the N-terminal acylated and/or crivity.

C-terminal amidated or esterified forms of up to 60 amino acids, where the peptide-type compound comprises the formula; A-B, where A, B = C. terminal amidated comprises the formula; A-B, where A, B = C. S. N; aa39 = R or (s. aa80 = I or N; aa77 = B, S. N; aa39 = R or (s. aa80 = I or N; aand aa represents amino acid. The sequence in the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The compounds comprise amino acid sequences related to a Class I HLA-B alphal domain (positions 79-84). They can be used to inhibit cytotoxic T-lymphocytes (CIL) from undestrably attacking cells in a host or in vitro. They can also be used in combination with antigenic peptides or proteins of interest to activate CILS. They can also inhibit the proliferation of T cells in response to anti-CD3. The peptide can be used for preventing rejection of transplants or for treating autoimmune diseases, e.g. diabetes, response to anti-CD3. The peptide can be used for preventing rejection cresponse to anti-CD3. The peptide can be used for preventing rejection cresponse to anti-CD3. The peptide can be used for preventing rejection creaming atthritis and lupus erythematosis. The products can also be chematoid arthritis and lupus erythematosis. The products can also be used for derection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
a suitable cell with an amphoteric detergent, and then passed through an affinity column containing a covalently bound HLA-B2702 palindromic peptide. Compositions comprising the extracellular fragment of p74 combined with HLA-B2702.60-84 (see R95416), induces calcium influx, and inhibits cytotoxic T lymphocyte (CTL) differentiation or cytolysis. Candidate compounds can be screened for their effect on the cytolytic activity of T-cells, by combining them with the extracellular portion of p74 and determining the amount of binding between the candidate compound and p74. Modulation of CTL activity can be inhibited in a cellular composition containing T-cells and antigen presenting cells (APCS), by adding to the mix the extracellular portion of p74, in an amount sufficient to compete with p74 for the binding of the p74 ligand. Sequence 20 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     W33791;

9-JON-1998 (first entry)

Peptide B2702.84-75T/75-84 tested for immunomodulating activity.

Immunomodulating dimer; immunosuppressant drug; CTL activation;

transplantation; autoimmune disease; Class I HLA-B alpha-1 domain;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         24-MAY-1996; US-653294.

Chromodomain-helicase-DNA-binding protein, CHD-1 - mouse
Chromodomain-helicase-DNA-binding protein, CHD-1 - mouse
Chromodomain-helicase-DNA-binding protein
Cjpecies: Mus musculus (house mouse)
Cjpecies: Mus musculus (house mouse)
Cjaccession: A47392; $21568
Cjaccession: A47392; $21568
Cjaccession: A47392; $21568
Cjaccession: A47392; Multiply
Cjaccession: A47392
Ajritle: A mammalian DNA-binding protein that contains a chromodomain and an SNF2/SWI
Ajrecession: A47392
Ajrecession: A47
                                                                                                                                                                                                          N'Alternate names: ret oncogene protein
N'Contains: protein-tyrosine kinase (EC 2.7.1.112) ret
C'Species: Homo sapiens (man)
C'Jace: Bond Sapiens (man)
C'Jace: 31-Mar-1989 #sequence_revision 10-Sep-1997 #text_change 13-Aug-1999
C'Accession: A27203
R'Jakabashi, M.; Cooper, G.M.
Roll: Biol: 7, 1378-1385, 1987
A/Title: ret transforming gene encodes a fusion protein homologous to tyrosine kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A;Molecule type: mRNA

- FUNCTION: SEQUENCE-SELECTIVE DNA-BINDING PROTEIN. COULD PLAY AN IMPORTANT ROLE IN GENE REGULATION.

- SUBCELLULAR LOCATION: NUCLEAR.

- SIMILARITY: BELONGS TO THE SNR2/RAD54 HELICASE FAMILY.

- SIMILARITY: CONTAINS 2 'CHROMO' DOMAINS.

- SIMILARITY: CONTAINS 3 'CHROMO' DOMAINS.

                                                                                    -:- SUBCELLULAR LOCATION: NUCLEAR.
-:- TISSUE SPECIFICITY: ABUNDANCE IS HIGHER IN CELLS REPRESENTING
EARLY STAGES OF THE BILWHOID LINEAGE SUCH AS PRE-B AND B CELLS,
THAN IN CELLS REPRESENTING MATURE PLASMACYTES OR OTHER CELL
LINEAGES SUCH AS FIBROBLASTS.
-:- SIMILARITY: BELONGS TO THE SNF2/RAD54 HELICASE FAMILY.
-:- SIMILARITY: CONTAINS 2 'CHROWO' DOMAINS.

                                                                                                                                                                                                                  SUBCELLULAR LOCATION: IF THE N-TERMINUS IS A FUNCTIONAL SIGNAL SEQUENCE, THE PROTEIN IS PREDICTED TO BE ORIENTED TOWARD THE LUMEN OF THE ENDOLAGANER RETICULUM WITH BOTH TERMINI SERVING AS ANCHORS. THE LACK OF A SIGNAL SEDUENCE INDICATES THAT THE ENZYME FACES THE CYTOPLASM AND IS ANCHORED AT THE C-TERMINUS.

DOMAIN: THE N-TERMINUS OF THE PROTEIN, THOUGH NOT HYDROPHOBIC, MEETS EXISTING CRITERIA FOR YEAST SIGNAL SEQUENCES, EVEN THOUGH NO SITE EXISTS FOR CLEAVAGE BY SIGNAL PEPTIDASE.

SIMILARITY: BELONGS TO THE GLYCOSYLIRANSFERASE FAMILY 2.
nitted (APR-1995) to the EMBL/GenBank/DDBJ databases.
FUNCTION: INVOLVED IN THE SYNTHESIS OF THE SUGAR DONOR DOL-P-MAN WHICH IS REQUIRED IN THE SYNTHESIS OF N-LINKED AND O-LINKED OLIGOSACCHARIDES AND FOR THAT OF GPI ANNHORS.
CATALTIC ACTIVITY: GDP-MANNOSE + DOLICHYL PHOSPHATE - GDP + DOLICHYL D-MANNOSYL PHOSPHATE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Eukaryota; Metazoa; Arthropoda; Tracheata; Hexapoda; Insecta;
